INDEPENDENT DEMO - SYNTHETIC FILES

Messy file inbox.
Clean, auditable folder.

Python automation that scans, classifies, validates, deduplicates, and plans a safe folder cleanup.

20	9	4	10/10
FILES SCANNED	ORGANIZED	DUPLICATES SKIPPED	TESTS PASSED

Visible decisions

Every duplicate, quarantine, and ignored file has a status and a reason.

Safe by default

Dry run first. The source folder is never deleted or modified.

No client names, logos, testimonials, or revenue claims. Synthetic files only.

01 - THE PROBLEM

A folder is not a system.

Inconsistent names, duplicate copies, corrupt exports, and unsupported files create a review burden. A manual cleanup hides decisions; the next batch recreates the same mess.

Before

```
VENDOR LIST FINAL (3).CSV
vendor list final (3) copy.csv
march statement copy.pdf
broken_export.csv
empty.csv
logo.png
```

After

```
2026-03-01_csv_vendor-list-final-3.csv
undated_pdf_march-statement.pdf
2026-03-07_csv_orders-2026-03-07.csv
quarantine/broken_export.csv
quarantine/empty.csv
quarantine/logo.png
```

The decision matrix

STATUS	MEANING	ACTION
Organized	Valid, recognized, and the clean copy of a file	Copy to `organized/`
Duplicate	Byte-identical to an already accepted file	Copy to `duplicates/` for review
Quarantined	Empty, malformed, corrupt, or unsupported	Copy to `quarantine/` with reason
Ignored	System or template file that is not business data	Leave in place; list in manifest

The rule: scan first. Validate second. Plan third. Apply only with an explicit flag. Keep the source, the manifest, and the exception log.

Representative manifest

SOURCE	STATUS	TARGET / REASON
`VENDOR LIST FINAL (3).CSV`	Organized	`2026-03-01_csv_vendor-list-final-3.csv`
`vendor list final (3) copy.csv`	Duplicate	`duplicates/ - skip copy`
`customer_export_2026-03-01.json`	Organized	`2026-03-01_json_customer-export-2026-03-01.json`
`export_without_extension`	Organized	`undated_csv_export-without-extension.csv`
`broken_export.csv`	Quarantined	`quarantine/ - unexpected end of data`
`logo.png`	Quarantined	`quarantine/ - unsupported type`

02 - THE BUILD

Python does the repetitive work. The audit trail stays visible.

What it does

- ✓ SHA-256 duplicate detection
- ✓ Content sniffing for extensionless files
- ✓ CSV / JSON / TXT / PDF metadata
- ✓ Safe copy into organized / duplicates / quarantine
- ✓ Excel summary + manifest + exceptions + plan

Validation snapshot

0.065s

Runtime on the 20-file synthetic demo.

10/10

Automated tests passed.

Not a promise for network drives or large batches.

Deliverables

FILE / FOLDER	PURPOSE
`file_inbox_report.xlsx`	Summary, manifest, exceptions, and organize plan
`manifest.csv`	Every file with type, hash, metadata, status, and target
`exceptions.csv`	Duplicate, quarantine, and ignore events with action taken
`organize_plan.csv`	Source-to-target plan with copy or skip action
`organized/ duplicates/ quarantine/`	Safe copies for review; source remains untouched

Run it

```
python src/file_inbox.py --input-dir data/raw/inbox --output-dir data/processed
python src/file_inbox.py ... --apply
```

The first command is a dry run. Add --apply only after reviewing the plan.

Test coverage

AREA	WHAT IS CHECKED
File naming	Spaces, symbols, dates, and extension normalization
Content detection	CSV without extension, JSON, PDF magic bytes, corrupt PDF
Duplicate logic	SHA-256 match, clean source-name preference, skip copy
Quarantine logic	Empty files, malformed CSV, unsupported types
Safe apply	Copies into organized/ and leaves the source in place
End-to-end	Manifest, exceptions, plan, JSON, and Excel workbook

03 - SCOPE AND FIT

Small, fixed-scope file automation.

Good fit

- ✓ Shared drives, download folders, and client intake folders
- ✓ Mixed CSV, JSON, TXT, and typed PDF files
- ✓ Clean naming conventions and audit trails
- ✓ One-off cleanup that may become recurring

Not a fit

- — Handwritten scans or low-quality images
- — Account passwords or unattended access
- — Deleting files without review or retention policy
- — "100% accuracy" without a written spec

A paid pilot, in three steps

01

Sample folder

Send 20-30 representative files and one naming rule.

02

Dry-run report

Review the manifest, duplicates, exceptions, and plan.

03

Apply + handover

Copy the approved set and receive the source + README.

Sample pack

- ✓ 20-file synthetic inbox
- ✓ Excel report + 3 CSV/JSON outputs
- ✓ Safe organize / duplicate / quarantine folders
- ✓ 10 automated tests
- ✓ README + dependency list
- ✓ Case page + 80-second demo video

Send one sample folder and the exact output naming rule.

I will confirm fit, scope, and a fixed price before work starts. The first run is a dry run; you review the manifest and exception log before any file is copied.

Engagement options

PACKAGE	SCOPE	STARTING POINT
Basic audit	One folder, up to 50 files, dry-run report	Fiverr $75
Standard workflow	Up to 200 files, naming rules, safe apply, source + README	Fiverr $150 / Contra $250
Premium workflow	Multi-folder rules, PDF metadata, recurring runbook, handover	Fiverr $300 / Contra $500+

Final quote depends on file types, folder structure, naming rules, and review volume. No unlimited revisions.

Independent demo. Synthetic files only. No off-platform payment or contact. AI-assisted build, human-reviewed and tested.
